# An annotated list of the mammals of San Diego County, California

# Suzanne I. Bond

In 1921, Frank M. Stephens, veteran San Diego naturalist and Curator at the Natural History Museum, published the first list of the mammals of San Diego County. He cited 65 species of land mammals (plus additional subspecies), and gave brief descriptions of their range and habitat. In the intervening five decades, much new information has become available as local scientists, including L. M. Huey and R. C. Banks, former Curators at the Natural History Museum, continued detailed studies of the local fauna. Unfortunately, there is no recent compilation of this information, and Stephen's paper has long since been out of print, so that local students have had little to guide them.

In this paper I have attempted to summarize current knowledge of the status and habitat preferences of each species, and to give details on scientific reference material in the San Diego Natural History Museum and other major western collections. I recognize 80 species (plus many more subspecies) as occurring in the county. The increase is due to the introduction of several species, the occurrence of natural vagrants (mainly migratory bats), and taxonomic changes. There is no up-to-date compilation of marine mammals that occur along the county coastline. For general information in California see Daugherty, 1972, Marine Mammals of California.

Scientific and common names in this paper are those used by Jones, Carter and Genoway's (1973) Checklist of North American Mammals North of Mexico, except where noted. Species are included here on the basis of specimens examined or from literature references. Localities are arranged alphabetically. "San Diego area" includes the area north to La Jolla, east to Santee-Lakeside-El Cajon, and south to and including Chula Vista. Locality names are those used on current maps and the spelling may differ slightly from that on the collected specimens. For

example, Mountain Springs was formerly known as Mountain Spring.

Life-zones listed are after J. Grinnell (1933). Life-zones, theoretically, are areas characterized by distinct assemblages of plants and animals (across North America from south to north, or from low to high). Three zones occur in San Diego County, as shown in Figure 1. One of the easiest ways to recognize life-zones is to learn the plants that typify them. In the Lower Sonoran Zone one finds desert plants such as cacti, agave, mesquite, creosote bush, yucca, arrowweed, and so forth. In the Upper Sonoran Zone, chamise, scrub oak, flat-top buckwheat, and chaparral plants predominate. The Transition Zone, at higher elevations, includes pines, firs, and cedars. Some species of mammals are restricted to certain zones and habitat types, whereas others are widespread.

I wish to thank the following for allowing me to examine catalogs and (or) specimens in their care: L. C. Binford, California Academy of Sciences (CAS); D. R. Patton, Los Angeles County Museum of Natural History (LACM); M. Getty, Anza Borrego Desert State Park (ABDSP); and W. Z. Lidicker, Jr., Museum of Vertebrate Zoology (MVZ). Gail Culver prepared the map. Ross Dingman added comments and several site records. For permission to reproduce the cover and text illustrations of Sheridan Oman, I thank Richard C. and Sharon Nelson, Tecolote

Press, Inc. of Glenwood, New Mexico.

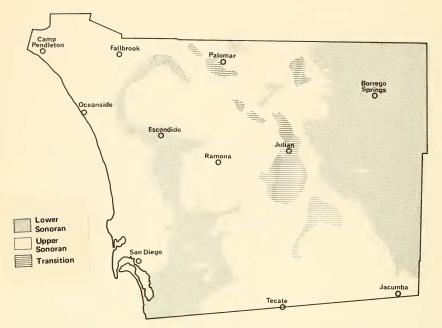

Figure 1. Life-zones of San Diego County (from Higgins, 1949, San Diego Soc. Nat. Hist., Occ. Paper 8).

# SPECIES ACCOUNTS

Order Marsupialia Family Didelphidae (Opossums)

• Didelphis virginiana
• Opossum
An introduced species first captured wild in California in 1914 near Agnew, Santa
Clara Co. (J. Grinnell, 1915: 114), and first taken in the county in La Puerta Valley
in 1926 (Bryant, 1927: 146). Opossums are omnivorous and are most often found
in coastal drainage areas near human habitation where they often act as scavengers.
Now rather common. SDNHM specimens: La Puerta Valley, San Diego area.

### Order Insectivora Family Soricidae (Shrews)

• Sorex ornatus ornatus

• Ornate Shrew Most abundant in the Upper Sonoran life-zone but found from the coast to the mountains. Usually in damp earth on slopes and sometimes in dry areas beneath chaparral. Uncommon. SDNHM specimens: Kearny Mesa, Julian, San Diego area. Stephens (1906: 252) reported finding two dead near Santa Ysabel. Other specimens (MVZ): Dulzura.

Notisorex crawfordi crawfordi
 Desert Gray Shrew Found mainly in the Lower Sonoran life-zone although not restricted to any particular habitat. Uncommon. SDNHM specimens: Borrego Palm Canyon, Encinitas, Escondido, San Diego area. Other specimens (MVZ): Bernardo, Santa Ysabel, Vallecito. New trapping techniques with better results indicate that shrews

may not be as rare as previously thought.

### Family Talpidae (Moles)

Scapanus latimanus occultus
 Broad-footed Mole Found mainly in the Upper Sonoran life-zone. The main limitation to its range seems to be sufficient soil moisture (Palmer, 1937: 281). Most common in the mountains. SDNHM specimens: Alpine, Ballena, Escondido, Jamacha, Julian, Ramona, Tecate. Other specimens (MVZ): Warner Pass, Witch Creek.

# Order Chiroptera Family Phyllostomatidae (Leaf-nosed Bats)

- Macrotus waterhousii californicus
   California Leaf-nosed Bat Found in the Lower Sonoran life-zone. This colonial species lives in caves or other protected areas and is seen only on the wing after twilight (Banks, 1965: 13). It probably hibernates during the colder months. SDNHM specimens: Anza Borrego Desert State Park area, Dulzura, Pauma Valley, Vallecito. H. Grinnell (1918: 255) reported them at De Luz and the Santa Margarita Ranch and River.
- Choeronycteris mexicana
   Long-tongued Bat Found usually in the Sonoran life-zone (Ingles, 1965: 117). This nectar-feeding bat is apparently a fall vagrant from Central Mexico. It was first recorded from the county in September 1946 (Olson, 1947: 183). Many subsequent records were obtained in October 1947 and 1963 and December 1947. SDNHM specimens: (39) all San Diego area.

# Family Vespertilionidae (Evening Bats)

- Myotis lucifugus

   Little Brown Myotis
  Never before recorded from southern California, this vagrant is listed here on the
  basis of a single specimen taken at Lake Hodges Dam in 1943 (LACM #8081).
  Found generally in forested areas, its southern limit is the San Bernardino Mountains (Miller and Allen, 1928: 51).
- Myotis yumanensis sociabilis

  Found chiefly in the Upper Sonoran life-zone west of the desert but east of the humid coastal belt in areas of oaks and pines or broken chaparral. SDNHM specimens: Barret Dam, El Monte Park, Lake Hodges. Other specimens (MVZ): Doane Valley, 4 mi. E Laguna Junction, San Diego area, Warner Springs. Miller and Allen (1928: 69) also reported it from San Luis Rey.
- Myotis evotis evotis

  A solitary bat found chiefly in the Transition and Upper Sonoran life-zones. Stephens (1921: 52) reported, "found throughout the county. Not common." There are no specimens in the collection, although they have been reported from Witch Creek (H. Grinnell, 1918: 294) and Dulzura and Twin Oaks (Miller and Allen, 1928: 117). Other specimens: Palomar Mountain (CAS); Doane Valley, Cuyamaca State Park (MVZ). Our catalog lists specimens from: Laguna Mountain (1059), Ballena (81), Witch Creek (82); all are missing.
- Myotis thysanodes thysanodes
   Fringed Myotis Said to be found in the Upper Sonoran life-zone in areas of heavy chaparral or

mixed forest and chaparral (J. Grinnell, 1933: 88). SDNHM specimens: Pine Valley (one). Other specimens (MVZ): Doane Valley, Laguna Junction. Miller (1897: 80) reported them at Dulzura.

- Myotis volans interior
   Long-legged Myotis
  Found from the Upper Sonoran to Transitional life-zones, Stephens (1921: 52)
  stated, "Generally distributed but not common in the coast region." SDNHM
  specimens: Julian (two). Other specimens (MVZ): Cuyamaca Mountains. Also
  reported from Dulzura (Miller and Allen, 1928: 143).
- Myotis californicus californicus
   California Myotis Found in the Transition and Upper Sonoran life-zones in wooded canyons or chaparral slopes along the Pacific coast region west of the mountains. SDNHM specimens: Ballena, Lake Henshaw, La Puerta Valley, Palomar Mountains, San Diego, Witch Creek. Other specimens (MVZ): Cuyamaca, Descanso, Julian area, Hubbard's Grove, Pala, Warner Springs. Another race, M. c. stephensi, is found in the Lower Sonoran life-zone in the desert region east of the mountains. SDNHM specimens: Anza Borrego Desert State Park area.
- Myotis leibii melanorhinus

   Small-footed Myotis A non-colonial species found in the Upper Sonoran and Transition life-zones among trees in semiarid areas. Fairly common. SDNHM specimens: Grapevine Canyon, Oriflamme Canyon, Pine Valley, San Diego, Santa Ysabel, and surprisingly Borrego Springs. Other specimens (MVZ): Boulder Oaks, Cuyamaca Rancho State Park, Julian, Laguna Junction, Manzanita, McCain Valley, near Vallecito (see Banks, 1965: 16), Wynola. Other localities: Dulzura, Jacumba, Santa Ysabel (H. Grinnell, 1918: 292); Twin Oaks, Witch Creek (Miller and Allen, 1928: 170).
- Lasionycteris noctivagans
   Silver-haired Bat
   Never recorded in southern California prior to 1973, when one was collected in a mist net at Agua Caliente Springs in February 1973 (specimen SDNHM). Subsequently, two others have been banded in the winter (T. McDonnell, pers. com.).
   Normally confined to the Transition life-zone, its former southern limit was Pacific Grove, Monterey Co. (H. Grinnell, 1918: 302).
- Pipistrellus hesperus

   Western Pipistrelle This is the smallest and most common of our bats. It is solitary and usually first seen at early dusk. The desert race, P. h. hesperus, is found mainly in the Lower Sonoran life-zone east of the Pacific divide. SDNHM specimens: Borrego Desert area. Also reported from: Dulzura and Santa Ysabel (H. Grinnell, 1918: 310). The coastal race, P. h. merriami, is found in the Upper Sonoran life-zone west of the Pacific divide. SDNHM specimens: De Luz, San Diego, San Marcos, Suncrest. Other localities (H. Grinnell, 1918: 312): Escondido, Twin Oaks, Witch Creek. H. Grinnell (p. 310) stated, "Specimens from Witch Creek (or Santa Ysabel), San Diego County, are allocated with difficulty, some appearing to be nearest hesperus and others nearest merriami."
- Eptesicus fuscus pallidus

   Big Brown Bat
  This bat is said to occur chiefly in the Upper Sonoran and Transition life-zones,
  although Krutzsch (1946: 240) reports them, "taken from all life-zones in San Diego
  County." There are no winter specimens, and Krutzsch considered them migratory.
  SDNHM specimens: Alpine, Ballena, Barrett Junction, Dehesa, Escondido, Julian,
  Potrero, Witch Creek; MVZ specimens: Campo, Cuyamaca Mountains, Deluz,
  Descanso, Doane Valley, El Monte Oaks, Fallbrook, Foster, Jamacha, Lakeside,

San Onofre, Santee; ABDSP specimens: Pinyon Mountain Valley. Other localities: San Felipe Canyon, Agua Caliente Hot Springs and Vallecito Stage Station (Banks, 1965; 20).

- Lasiurus borealis teliotus · Red Bat A solitary, tree-dwelling bat found west of the desert divide in the winter and
- spring. The sexes seem to separate during the summer with the females in the Lower Sonoran life-zone and the males in the Upper Sonoran (H. Grinnell, 1918: 326). SDNHM specimens: San Diego area, San Onofre, San Ysidro, Witch Creek. Other specimens: Escondido (MVZ); Santa Ysabel (H. Grinnell, 1918; 329).
- Lasiurus cinereus cinereus Also a solitary, tree-dwelling, migratory bat found in the valleys during the winter. SDNHM specimens: Del Mar, Jamacha, Jamul, Rancho Santa Fe, San Diego area. Other specimens (MVZ): Bonsall, San Marcos, San Pasqual. Also reported from Santa Ysabel (H. Grinnell, 1918: 329).
- · Lasiurus ega xanthinus · Southern Yellow Bat. A vagrant from southern Mexico that was first recorded from the county in June 1967 (Bond, 1970: 115). The six specimens in the collection are from Borrego Springs.
- Euderma maculatum Vagrant. This bat is reported from the county on the basis of one specimen taken at the University of San Diego and now in their collection (August and Dingman, 1973: 166). Miller and Stebbins (1964: 283) report, "The natural history of this rare bat is almost unknown. The occurrences of it are chiefly in the arid or semiarid sections of the western United States."
- Plecotus townsendii pallescens • Townsend's Big-eared Bat Found mainly in the Lower and Upper Sonoran life-zones either in colonies or singly. This bat is a cave-dweller, but is sometimes found in attics and barns. SDNHM specimens: Barrett Dam, Escondido, Julian, Ramona, San Diego, Vallecito. Other specimens (MVZ): Agua Caliente, Banner, Blair Valley, Borrego Palm Canyon, El Monte Oaks. Krutzsch is said to have reported them at Otay Mountain (Hall and Kelson, 1959; 200).
- Antrozous pallidus Primarily a species of the Lower and Upper Sonoran life-zones. These bats are found in colonies during the spring, summer, and early fall months. Little is known of their winter behavior. They occur in various habitats (see Orr, 1954). Two races are found in the county. A. p. pacificus occurs along the Pacific slope side of the mountains. SDNHM specimens: Jamacha, Ramona, San Diego area, Santa Ysabel, Other specimens (MVZ): Ballena, Campo, Descanso, Fallbrook, Las Flores, Julian. A. p. pallidus is found in our desert region. SDNHM specimens: Jacumba, Other specimens: Agua Caliente Hot Springs (ABDSP); Vallecito (H. Grinnell, 1918: 351).

#### Family Molossidae (Free-tailed Bats)

• Tadarida brasiliensis mexicana • Brazilian (Mexican) Free-tailed Bat A colonial bat found in the Lower and Upper Sonoran life-zones. In the county they are most abundant on the western slopes of the mountains. Krutzsch (1955: 236) reported them from 4 mi. E Fallbrook to 2 mi. E San Pasqual, Green Valley Falls, Santee and El Monte Oaks Park. SDNHM specimens: Borrego Springs, Carrizo Creek, Dulzura, Escondido, Jacumba, Ramona, San Diego area, Sweetwater Dam. Other specimens: Descanso, Fallbrook (MVZ); San Luis Rey (USNM, Shamel,

1931: 6). Banks (1965: 23) reported a specimen from Agua Caliente in our collection that cannot be found.

- Tadarida femorosacca
   Pocketed Free-tailed Bat Another colonial bat evidently found in the Lower Sonoran life-zone and into the Upper Sonoran (Krutzsch, 1944: 414). There are no specimens in the collection, but Krutzsch (1944: 201) observed them in Palm Canyon, Borrego Valley and at Suncrest (1944: 410, 414). There are two specimens in the MVZ from Palm Canyon.
- Tadarida macrotis

   Big Free-tailed Bat
  A rare bat found in the Lower Sonoran life-zone. It is a vagrant known from three
  specimens collected in San Diego (SDNHM, Huey, 1932: 160; 1954: 435; and Natural
  History Museum of the University of San Diego, August and Dingman, 1973: 165).
- Eumops perotis californicus
   Western Mastiff Bat Found in the Lower and Upper Sonoran life-zones. A permanent resident in southern California where chaparral and live oaks are found, and in more arid, rocky areas. SDNHM specimens: Bow Willow Ranger Station (Borrego Desert), Dulzura, San Diego, and Yaqui Wells. Other specimens (MVZ): Barrett Junction, Lake Hodges. H. Grinnell (1918: 372) reported them from Dos Cabezas (Borrego Desert) and Otay.

# Order Lagomorphia Family Leporidae (Rabbits and Hares)

- Sylvilagus bachmani cinerascens

   Brush Rabbit A common cottontail rabbit found in the Upper Sonoran life-zone from sea level to the mountains, and in dense chaparral along the Pacific coast region. They do not appear to make use of burrows as does the Desert Cottontail (Orr, 1940: 173). SDNHM specimens: Ballena, Encinitas, Escondido, Lyon's Peak, San Diego area, San Felipe Valley, San Marcos. Other specimens (MVZ): Alpine, Cuyamaca Mountains, Dulzura, Grapevine Springs. Other reported localities (Nelson, 1909: 253): Laguna, Jacumba, Santa Ysabel.
- Sylvilagus audubonii

   Desert (Audubon) Cottontail
  A common cottontail of the lowlands that might be mistaken for a Brush Rabbit
  except for its larger size. It never penetrates far into the chaparral (Orr, 1940: 126).
  The desert race, S. a. arizonae, is found in the Lower Sonoran life-zone. SDNHM
  specimens: La Puerta Valley, Palm Spring-Mesquite Oasis. Other specimens (MVZ):
  Vallecito. S. a. sanctidiegi is found in the Lower and Upper Sonoran life-zones along
  the coast from sea level to above 4000 feet in chaparral or open grassland. SDNHM
  specimens: Carlsbad, Grapevine Canyon, Ramona, San Diego area, Santa Ysabel,
  Tia Juana River Valley. Other specimens (MVZ): Cuyamaca Mountains, Dulzura,
  Escondido, Julian, Oak Grove, Otay Valley, San Felipe Canyon, Warner Pass,
  Witch Creek. Other reported localities: Jacumba, Twin Oaks, Mountain Springs,
  Warner Valley (Nelson, 1909: 220); San Marcos (Orr, 1940: 122).
- Lepus californicus
   Black-tailed Jack Rabbit (Hare)
  Our largest "rabbit," generally found only in open or semi-open country. Thick
  chaparral or forested regions are unsuitable (Orr, 1940: 80). L. c. bennettii is found
  in the Upper Sonoran life-zone along the coast to the western base of the coastal
  mountains from sea level to 6000 feet on Cuyamaca Mountain (J. Grinnell, 1933:
  201). SDNHM specimens: Live Oak Springs, San Diego, Santa Ysabel. Other
  specimens: San Marcos (MVZ); Escondido, Tijuana River (Orr, 1940: 74); Dulzura,
  Jacumba, Jamul Creek, Laguna Mountains, Mountain Springs, Twin Oaks (Nelson,
  1909: 137). The type specimen for this animal was collected in the early 1840s at

San Diego during the voyage of H.M.S. Sulphur, under the command of Captain Sir Edward Belcher. The desert race, *L. c. deserticola*, is found east of the coastal mountains in the Lower Sonoran life-zone along the foothills in clear chaparral areas and on the desert floor. This is the common desert "rabbit." SDNHM specimens: La Puerta Valley, San Felipe Canyon, Vallecito. Specimens from the last two localities have been allocated to both races (Orr, 1940: 73; Nelson, 1909: 140).

#### Order Rodentia Family Sciuridae (Squirrels)

- Eutamias merriami merriami
   Merriam's Chipmunk
  Found in the Upper Sonoran to lower Transition life-zones in mixed forest. This is
  the only chipmunk found in the county. SDNHM specimens: Cuyamaca Mountains,
  Laguna Mountains, Palomar Mountain, Warners Ranch, Witch Creek. Other specimens: Julian (MVZ); Jacumba, Mountain Springs, Santa Ysabel, Volcan Mountain,
  Warner Pass (Howell, 1929: 126).
- Ammospermophilus leucurus leucurus

 White-tailed Antelope (Ground) Squirrel

A common desert ground squirrel, found mainly in the Lower Sonoran and occasionally Upper Sonoran life-zones where the general environment is desert-like with thick vegetation. SDNHM specimens (many) are all from the desert region east of the mountains. Also reported from Jacumba and Mountain Springs (Howell, 1938: 172).

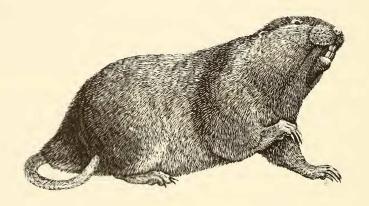

- Spermophilus beecheyi nudipes
   California Ground Squirrel Found from the Lower Sonoran to the Transition life-zones, but most abundant in the Upper Sonoran zone. This is the common ground squirrel from the mountains and west to the sea. SDNHM specimens: Ballena, Camp Pendleton area, Cuyamaca Mountains, Jamacha, Laguna Mountain, Pine Hills, San Diego area, Santa Ysabel, Valley Center, Witch Creek. Other specimens (MVZ): Campo, Dulzura, Grapevine Springs, Jacumba, Julian, Mountain Springs, Oak Grove, Warner Pass, Wynola. Banks (1964: 15-16) observed them at Culp Valley, Pena Spring, Pinyon Mountain Valley, and Sentenac Canyon. Also reported at McCain Valley and Borrego Palm Canyon (R. Dingman, pers. obs.).
- Spermophilus tereticaudus tereticaudus
   Round-tailed Ground Squirrel
  Another common desert ground squirrel, found in the Lower Sonoran life-zone
  where the vegetation is low and sparse. Told from the White-tailed Antelope
  Squirrel by the lack of body stripes. Seldom seen in the winter months. Specimens
  in the collection are from the desert area.
- Sciurus carolinensis
   Gray Squirrel
  This species of tree squirrel was introduced from the eastern part of the United
  States into many city parks and private estates. A note found in the mammal
  catalog from 1924 states it was introduced into Balboa Park by the San Diego Zoo.
   Its present status is not known. There is one specimen in the collection from
  Balboa Park.
- Sciurus griseus anthonyi

   Western Gray Squirrel
  Found generally in the Transition life-zone, this is the common tree squirrel in
  mixed oak and pine forest of the mountains. SDNHM specimens: Banner Grade,
  Barona Indian Reservation, Cuyamaca Mountains, Escondido, Julian, Laguna
  Mountains, Palomar Mountains, Pine Mountain. Other specimens (MVZ):
  Warner Pass.

Sciurus niger
 Fox Squirrel
Another species introduced from the eastern United States (date unknown). This
squirrel can be commonly seen in Balboa Park. SDNHM specimens: three from
Balboa Park. The earliest specimen is dated 1929.

# Family Geomyidae (Pocket Gophers)

• Thomomys bottae<sup>1</sup>
• Southern Pocket Gopher This is one of the most common and widespread mammals in the county. It occurs wherever vegetation grows and the soil is loose enough for them to burrow through. A fossorial gopher rarely seen above ground. There are five recognized races: T. b. affinis, from the Jacumba area; T. b. boregoensis, from Borrego Desert region; T. b. nigricans, found largely in the mountains; T. b. puertae, restricted to the La Puerta, San Felipe valleys; T. b. sanctidiegi, found along the coastal region.

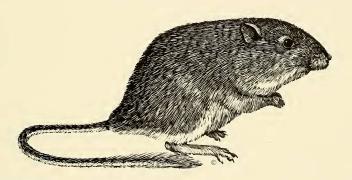

Pocket Gopher

# Family Heteromyidae (Pocket Mice)

 Little Pocket Mouse Perognathus longimembris This is the smallest species of pocket mouse and the smallest rodent in the county. Like all pocket mice, it is nocturnal and seldom seen. Generally found in areas of fine sandy ground. There are four recognized races. P. l. bangi, found in the Lower Sonoran life-zone in our eastern desert region. SDNHM specimens: Borrego Desert area. P. l. brevinasus, found in the high Lower to low Upper Sonoran life-zones. SDNHM specimens: near Oak Grove, Ranchita, Warner Pass. P. l. internationalis, found in the immediate area of Jacumba, although Huey (1939: 48) stated that specimens from La Puerta, San Felipe Valley, and Warner's Pass were not typical. SDNHM specimens: Jacumba area, La Puerta Valley, San Felipe Valley, W side Blair Valley. There appears to be some intergradation of subspecies in the La Puerta Valley area (Banks, 1964: 21). P. l. pacificus, found in the Upper Sonoran life-zone along a narrow coastal strip running from the Tia Juana River Valley north to Los Angeles Co. SDNHM specimens: Oceanside, San Onofre, Tia Juana Valley. Also reported from mouth of Santa Margarita River (von Bloeker, 1932: 129).

<sup>1</sup>bottae after Patton and Dingman, 1968: 1-13.

- Perognathus formosus mesembrinus
   Long-tailed Pocket Mouse
   Found in the Lower Sonoran life-zone in gravelly, rocky areas in our desert.
   SDNHM specimens: Fish Creek Wash, Ocotillo Wells, San Felipe Canyon, Vallecito area. Other localities: La Puerta Valley (von Bloeker, 1932: 279); Borrego Palm Canyon (R. Dingman, pers. obs.).
- Perognathus baileyi hueyi
   Bailey's Pocket Mouse
  This rare pocket mouse is found in the Upper Sonoran life-zone on rocky steep
  slopes in our desert region. SDNHM specimens: San Felipe Narrows (only two).
  Other specimens: Mountain Springs, Yaqui Wells (MVZ); Borrego (CAS). Also
  reported from Banner and La Puerta Valley (von Bloeker, 1932: 279).
- Perognathus penicillatus angustirostris
   Desert Pocket Mouse
   Found in the Lower Sonoran life-zone in open sandy desert areas. SDNHM
   specimens: Borrego Desert area, La Puerta Valley, San Felipe Narrows, Vallecito.

**Pocket Mouse** 

- Perognathus fallax
   San Diego Pocket Mouse Found from the Lower to Upper Sonoran life-zones usually in somewhat open, sandy land with weeds. The coastal race, P. f. fallax, is found on the Pacific drainage side of the mountains. SDNHM specimens: Ballena, Del Mar, Dulzura, Jacumba area, Lake Hodges, Pala, San Diego area, San Marcos, Tia Juana River Valley. P. f. pallidus is found mainly in the Lower Sonoran life-zone on the eastern side of the mountain divide. SDNHM specimens: Earthquake Valley, Grapevine Canyon, La Puerta Valley, Ranchita, San Felipe Valley. Other records: 4 mi. W Yaqui Wells and San Felipe Narrows (Banks, 1964: 27).
- Perognathus californicus fermoralis
   California Pocket Mouse
   This pocket mouse is found chiefly in the Upper Sonoran life-zone in the coastal and montane regions on chaparral slopes. SDNHM specimens: Banner, Campo, Dehesa, Dulzura, Escondido, Pala, Rainbow, Ramona, Palomar Mountain, San Marcos, Santee, Santa Ysabel, Witch Creek. Other localities: San Felipe Valley (MVZ); La Puerta Valley (von Bloeker, 1932: 279).

- Perognathus spinatus rufescens
   Spiny Pocket Mouse
   Found in the Lower Sonoran life-zone in rocky rough terrain on the desert and east slopes of the coastal mountains. SDNHM specimens: Borrego Desert area, La Puerta Valley, Ranchita, San Felipe Canyon, San Felipe Narrows, Vallecito. Also reported from Mountain Springs (J. Grinnell, 1933: 156).
- Dipodomys stephensi
   Stephens' Kangaroo Rat
   A rare kangaroo rat found in the Lower Sonoran life-zone in areas of sparse vegetation. It is known in the county only from an isolated area near Bonsall (Lackey, 1967). SDNHM specimens: Bonsall, 7 mi. E Oceanside, 2 mi E San Luis Rey Mission.
- Dipodomys agilis
   Agile Kangaroo Rat This is the common kangaroo rat of the Pacific Coast of southern California. D. a. cabezonae is found in the Lower Sonoran life-zone on the slopes of the coastal mountains in loose soil with sparse vegetation. SDNHM specimens: Banner, Jacumba area, Oakgrove, Sunrise Highway, Warner Springs. Other specimens: Borrego Desert area, Julian, McCain Valley, Mountain Springs (MVZ); Culp Valley (ABDSP). Other localities: Grapevine Spring, La Puerta Valley, San Felipe Valley (J. Grinnell, 1922: 96). D. a. simulans occurs chiefly in the Upper Sonoran life-zone on the Pacific slopes of the mountains in areas of chaparral and sandy ground. SDNHM specimens: Bonsall, Cuyamaca Mountains, De Luz, Dulzura, Escondido, Jack Creek, Lake Hodges, Pala, Palomar Mountain, Pine Valley, Proctor Valley, Poway, Rincon Springs, San Diego area, San Marcos, San Pasqual Valley, Santa Ysabel, Tia Juana River Valley, Witch Creek.
- Dipodomys merriami
  Merriam's Kangaroo Rat This small kangaroo rat is found generally in the Lower Sonoran life-zone in loose, sandy, gravelly ground with sparse vegetation. This is the common desert kangaroo rat. There are three recognized races in the county based on Lidicker's (1960) studies. D. m. arenivagus is a desert race. SDNHM specimens: Borrego Valley area, Bow Willow, Carrizo Creek, Mortero Canyon, Ocotillo Wells, Vallecito area. D. m. collinus is another desert dweller found in the western part of the desert. SDNHM specimens: Blair Valley, Earthquake Valley, La Puerta Valley, Oak Grove, San Felipe Valley. D. m. trinidadensis occurs in the Jacumba area (only one SDNHM specimen). Lidicker (1960: 196-198) lists specimens from Mountain Springs and Jacumba and states that this race intergrades with D. m. arenivagus in the Mountain Springs region. D. m. arenivagus and D. m. collinus also appear to intergrade in the San Felipe Narrows and Vallecito area. For details on intergradation see study by Lidicker (1960: 190-196).
- Dipodomys deserti deserti
   Desert Kangaroo Rat
   This is our largest kangaroo rat found in the Lower Sonoran life-zone in areas of deep wind-driven sand and sparse vegetation. SDNHM specimens: Borrego Valley, Carrizo Creek, La Puerta Valley, Scissors Crossings. Other specimen (ABDSP): Vallecito.

# Family Castoridae (Beavers)

• Castor canadensis
• Beaver The beaver, the largest native rodent in North America, was introduced into the county in 1944. It is now found in the Upper Sweetwater River in the Cuyamaca Mountains (Cal. Fish and Game, pers. comm.) and in the San Luis Rey River below the Lake Henshaw dam (pers. obs.). There are no specimens in the collection from the county.

#### Family Cricetidae (Native Rats and Mice)

• Reithrodontomys megalotis longicaudus

• Western Harvest Mouse Found mainly in the Upper Sonoran life-zone and locally in the Lower Sonoran in moist grassy areas. SDNHM specimens: from the Tia Juana River Valley north along the coast to Oceanside-Vista area to Los Flores, Ballena, Cuyamaca Mountain, Descanso, El Monte, Escondido, Grapevine Canyon, Laguna Mountain, Lake Hodges, La Puerta Valley, Pinyon Mountain Valley, Proctor Valley, Sentenac Canyon, Warner, Vallecito. Other specimens (ABDSP): Earthquake Valley, Palm Springs, Mesquite Oasis. J. Grinnell (1933: 170) considered specimens from Vallecito and Mountain Springs to be intergrades toward R. m. megalotis.

Peromyscus crinitus stephensi
 Canyon Mouse
 This member of the White-footed mouse group is found in the Lower Sonoran life-zone in rough rocky areas in our desert region. SDNHM specimens: Borrego Valley, Bow Willow Campground, Fish Creek Wash, Mortero Canyon, Ocotillo Wells area, Pinyon Mountain, Seventeen Palms Oasis. Also reported from San Felipe Valley (Osgood, 1909: 234). This mouse is similar to the Cactus Mouse (P. eremicus) and is sometimes difficult even for experienced persons to identify.

Peromyscus californicus insignis
 California Mouse
 This is the largest of the White-footed mice in the county. It is commonly found in the Upper Sonoran life-zone in chaparral covered slopes. SDNHM specimens: from the San Diego area north along the coast to Los Flores Mission, Dehesa, Dulzura, Escondido, Poway, Rainbow, Santa Ysabel, Scissors Crossing, Witch Creek. Other localities: Campo, Jacumba, Jamul Creek, Mountain Springs, Santa Ysabel, Twin Oaks (Osgood, 1909: 238); 6 mi. N Foster, Julian, La Puerta Valley, San Felipe Valley, Warner Pass (Grinnell and Orr, 1934: 220).

• Peromyscus eremicus

• Cactus Mouse
This is the second commonest White-footed mouse in the county. The desert race,
P. e. eremicus, is found in the Lower Sonoran life-zone in arid lowlands on sandy
desert floors. It is the most abundant rodent in our desert and SDNHM specimens
are from varioùs areas in the Borrego Desert (see Banks, 1964: 43-46). P. e. fraterculus is the coastal race found in the Upper Sonoran life-zone west of the coastal
mountains in areas of sparse, shrubby vegetation. SDNHM specimens: Dehesa,
Dulzura, Escondido, Pala, Poway, San Diego area, San Marcos, San Pasqual, Tia
Juana River Valley. Other localities: Chihuahua Mountains, Jamul Creek, Jacumba,
Mountain Springs, Santa Ysabel, Twin Oaks (Osgood, 1909: 244): Campo (J. Grinnell, 1933: 173). The races seem to intergrade in the Mountain Springs and Jacumba
areas (Grinnell, op. cit.).

· Peromyscus maniculatus

 Deer Mouse This is the most abundant, widespread mammal in California. In the county it is found in nearly all the habitats from the Lower Sonoran to the Transition zones. Two subspecies occur. P. m. gambelii, with over 250 specimens in our collection, ranges from the extreme western edge of the desert to the coastal area. P. m. sonoriensis, the desert race, is found in the Lower Sonoran life-zone. SDNHM specimens: Borrego Valley, Jacumba, La Puerta Valley, San Felipe Valley, Warner's Ranch, Vallecito. The two races intergrade in the mountains and western desert area (see Banks, 1964: 46, and J. Grinnell, 1933: 174).

- Brush Mouse Peromyscus boylii rowleyi Common locally in the Upper Sonoran life-zone, on wooded or brushy slopes in arid or semi-arid regions. SDNHM specimens: Ballena, Cuyamaca Mountains, Dehesa, Doane Valley, El Monte, Escondido, Jamul Rancho, Laguna Mountains, Margarita Peak, Pinyon Mountain Valley, Rainbow, Santa Ysabel, Sentenac Canyon, Witch Creek. Other localities (Osgood, 1909: 146-147): Chihuahua Mountains, Jacumba, Julian, Mountain Springs, Oak Grove, Smith (= Palomar) Mountain.
- · Piñon Mouse · Peromyscus truei martirensis This mouse of the high country is found in the Upper Sonoran to the Transition life-zones on dry slopes covered with scrub oak type vegetation. Not common. SDNHM specimens: Culp Valley, Mountain Springs, Monument Peak in the Laguna Mountains.
- Southern Grasshopper Mouse • Onychomys torridus This mouse resembles a short-tailed Peromyscus and does not seem to be restricted to any one habitat. It is not as common as the white-footed group. Two races are found in the county. O. t. pulcher is found in the Lower Sonoran life-zone in desert areas of shrubby vegetation. SDNHM specimens: Blair Valley, Grapevine Canyon, Mason Valley, Mountain Springs. Other specimens: Earthquake Valley (ABDSP); Scissors Crossing (MVZ). O. t. ramona is found in the Lower and Upper Sonoran life-zones on the Pacific slopes. SDNHM specimens: Carlsbad, Culp Valley, Dulzura, San Diego, San Pasqual Valley, Tia Juana River Valley. Other localities (Hollister, 1919: 469): Jacumba, La Puerta Valley, Warner Pass. Banks (1964: 50) states that the two races intergrade and that identification is difficult.
- White-throated Woodrat Neotoma albigula venusta This native rat is found in the Lower Sonoran life-zone and reaches its western range limits in our eastern county. Not common. SDNHM specimens: Borrego Springs, Carrizo Creek. Banks (1964: 54) collected one near Ocotillo Wells.
- (White-footed) Desert Woodrat Neotoma lepida The common name for this mammal is somewhat misleading since it is found in the mountains and along the coast as well as in the desert. There are three recognized races in the county. N. l. gilva is found in the Lower and Upper Sonoran lifezones usually in rocky or shrubby vegetative arid plains. There is only one specimen in the collection from Mountain Springs. Other specimens (MVZ): Jacumba, Manzanita. Goldman (1932: 64) states that gilva is an intergrading form connecting lepida and intermedia. A common coastal wood rat, intermedia, occurs mainly in the Upper Sonoran life-zone on the western slopes of the mountains in chaparral areas. SDNHM specimens: Bonsall, Mission San Luis Rey north along the coast to San Onofre Mountain, Fortuna Mountain, Mission Gorge, Murphy Canyon, Murray Dam, Proctor Valley, San Diego area, Santa Ysabel, mouth of the Tia Juana River, Witch Creek. Other specimens (MVZ): Dulzura, Jacumba, Julian. Also reported from Jamul and Poway (Goldman, 1910: 44). N. l. lepida is a desert race

restricted to rocky and (or) agave covered areas in the Lower Sonoran life-zone. SDNHM specimens: various localities within Anza Borrego Desert State Park (see Banks, 1964: 56), Borrego Springs, near Ocotillo Wells.

- Neotoma fuscipes macrotis
   Dusky-footed Woodrat
  This large woodrat is found chiefly in the Upper Sonoran life-zone in heavy
  chaparral areas usually near water. It occurs from the mountains to the coast.
  SDNHM specimens: Tia Juana River Valley, San Diego area north along the coast
  to San Clemente, Grapevine Canyon, Poway, near Ranchita, San Marcos, Santa
  Ysabel, Witch Creek. Other specimens (MVZ): Campo, Canebrake Canyon, Oakgrove, Warner Pass. Hooper (1938: 232) examined specimens from Escondido
  and Julian.
- Microtus californicus sanctidiegi
   California Vole
  This medium size mouse with coarse brown fur, short ears, and a short tail is found
  in the Lower Sonoran to Transition life-zones. It is common near water in grassy
  or marshy areas. SDNHM specimens: San Diego area north along the coast to
  Oceanside, inland from Ballena, Palomar Mountain, Escondido, Julian, Ramona,
  Santa Ysabel, Witch Creek. Specimens from Sentenac Canyon may prove to be an
  undescribed race (Banks, 1964: 58). Other specimens (MVZ): Dulzura, Jacumba,
  La Puerta Valley, Mountain Springs, Vallecito. Also reported from the Cuyamaca
  Mountains and Warner Pass (Kellogg, 1918: 31).

# Family Muridae (Old World Rats and Mice)

- Rattus rattus

   Black (Roof) Rat
  This Old World rat was introduced in the New World as early as 1544 and has been
  found in San Diego since 1856 (Baird, 1857: 440). It was not considered numerous
  in 1921 (Stephens, 1921: 46) but is now commonly found around areas of human
  habitation. SDNHM specimens: San Diego area.
- Rattus norvegicus
   Norway (Brown) Rat Another introduced Old World rat that first appeared in 1775. Before 1851 it was not found on the Pacific coast, but was abundant in 1856, when specimens were taken in San Diego (Baird, 1857: 439). This rat is also found around human habitation and Stephens (1921: 45) reported them as "thoroughly established. Abundant in towns and becoming common in the country." There are no specimens in the collection from the county. The Black Rat seems to have replaced it (San Diego County Department of Public Health, pers. comm.).
- Mus musculus

   House Mouse This Old World animal probably came to the New World with the earliest explorers. Found in both cultivated and uncultivated areas, it was reported from San Diego as early as 1856 (Baird, 1857: 444). Now very common. SDNHM specimens: El Cajon, Fortuna Mountain, Oceanside, San Diego area.

#### Family Capromyidae (Coypus)

• Myocaster coypus

• Nutria or Coypu
This South American rodent, first introduced in California in 1942, near Oakdale,
Stanislaus Co. (Howard, 1953: 513), has since become feral. It inhabits areas around
water much like the muskrat (Ondatra) and has been reported wild in San Diego
Co. since 1948 (Ingles, 1965: 309). There is a partial skull in the collection which
was found in Mission Valley. According to the California State Fish and Game
Department (pers. comm.) there are none in the area at this time.

# Order Carnivora Family Canidae (Dogs and Allies)

• Canis latrans clepticus

• Coyote This native dog is commonly found in the Upper and Lower Sonoran life-zones up into the Transition zone inhabiting open valley floors and forested areas with clearings. This race is said to be a connecting form between ochropus on the north and peninsulae on the south (Jackson, 1951: 295). It also intergrades with mearnsi on the east and it is difficult to properly ascribe specimens to race. SDNHM specimens: Borrego Springs, La Puerta Valley, Los Flores Mission, Los Penasquitos Canyon, Poway, San Diego area, Warner Springs, Vallecito. Other reported localities: Jacumba, Julian, San Marcos (Jackson, 1951: 295); San Felipe Valley, San Onofre, Tia Juana River (as C. l. ochropus, Grinnell, et al., 1937: 501).

Vulpes macrotis arsipus
 Kit Fox
 This uncommon small fox is found in level desert areas of the Lower Sonoran life-zone where the substrate is sandy. There is only one specimen in the collection, from La Puerta Valley. Stephens (1921: 50) reported trapping them at Borrego Springs. The Anza Borrego Desert State Park Rangers report seeing them throughout the park (M. Getty, pers. comm.).

• Vulpes macrotis macrotis

• Long-eared Kit Fox — EXTINCT This race of the kit fox occurred along the coast in the Lower Sonoran life-zone and is "rather certainly now extinct" (Allen, 1942: 197). One specimen (skin only) in the collection was taken one mile north of Rancho Santa Fe in 1931. Its identity was confirmed by R. S. Hoffman (1976, Visiting Fellow, National Museum of Natural History).

Urocyon cinereoargenteus californicus
 Gray Fox
 A common fox found chiefly in the Upper Sonoran life-zone and down into the
 Lower Sonoran in chaparral areas. It feeds primarily on ground squirrels and other
 small mammals. SDNHM specimens: Anza Borrego Desert State Park, Ballena,
 Escondido, Los Flores Mission, Potrero Grade, Ramona, San Diego area, San
 Marcos, Santa Ysabel, Witch Creek. Other specimens (MVZ): Campo, Cranebrake
 Canyon, La Puerta Valley, Pine Mountain.

# Family Ursidae (Bears)

• Ursus americanus

• Black Bear This species, which normally occurs from Ventura Co. north, was introduced to the Campo area and the Cuyamaca Mountains between 1917-1919 by a group of servicemen (Abbott, 1935: 150). Apparently they soon died out. The collection contains a single skull of a female taken in 1934 at Potrero, probably the last of this group of animals. In recent years the black bear has been sighted in Camp Pendleton (1975) and Lake Henshaw and the Palomar Mountain area (1976), and an adult male was shot in June 1976 near Buckman Springs, 5 miles south of Pine Valley. These bears are thought to be coming in from the San Bernardino Mountains to the north.

• Ursus magister
• Southern California Grizzly — EXTINCT This, the largest grizzly bear known outside of Alaska, was "rather common in the mountains" nearly one hundred years ago (Stephens, 1921: 51). There are no specimens in the collection from the county, but two taken at San Onofre and Trabuco canyons are in the USNM (nos. 156594, 160155). The last individual was shot in 1908 (Storer and Tevis, 1955: 28). Other recorded sites: Palomar Mountain (Bell, 1930: 108); Pine Valley (Abbott, 1935: 151); Santa Rosa Mountains (J. Grinnell, 1933: 98).

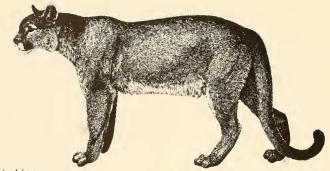

#### Family Procyonidae (Raccoons and Allies)

- Bassariscus astutus octavus
   Ringtail (Ring-tailed Cat)
  Found on the Pacific slope in the Upper Sonoran life-zone in brush and chaparral,
  along with Peromyscus and Neotoma, its main food. A nocturnal animal not commonly seen. SDNHM specimens: Borrego area on the Montezuma Grade, Live Oak
  Springs, San Diego, San Luis Rey River near Escondido, Sentenac Canyon. Other
  localities: foot of Palomar Mountain (Stephens, 1921: 51); Jacumba (J. Grinnell,
  1933: 100).
- Procyon lotor psora
   Raccoon Found generally in the Upper Sonoran life-zone along streams, in marshes and near lakes. Seldom seen due to its nocturnal habits. It is probably the most omnivorous native carnivore in the county (Ingles, 1965: 357). SDNHM specimens: Los Flores Mission, San Diego area, Santa Ysabel. Other specimens (MVZ): Cuyamaca Mountains, Julian. Also reported from Palomar Mountain (R. Dingman, pers. obs.).

# Family Mustelidae (Weasels and Allies)

- Mustela frenata latirostris
   Long-tailed Weasel Found in all habitats near water, from the Lower Sonoran through the Upper Sonoran life-zones. Frequently found in area of old gopher (Thomomys) and ground squirrel (Spermophilus) burrows, which it uses for its nest area. Active both day and night, feeding mostly on small rodents. SDNHM specimens: Cardiff, Escondido, Lakeside, Jamacha, Mount Woodson, San Diego area, San Marcos, Santee, Tia Juana River bottom. Other reported localities (Hall, 1951: 327): Ballena, El Cajon, Julian, Twin Oaks, Witch Creek.
- Taxidea taxus
   Badger Not commonly seen, the badger is most active during the late afternoon hours. There are two races in the county. T. t. berlandieri is found on the eastern side of the coastal mountains. SDNHM specimens: La Puerta Valley. T. t. neglecta is found west of the mountains and appears to have no zonal restrictions (J. Grinnell, 1933: 108). It is found in levelish, open, unforested areas. SDNHM specimens: Lakeside, Escondido, Ramona, San Marcos, Sweetwater Reservoir, Witch Creek. Other reported sites are near El Cajon (Grinnell, et. al., 1937: 361).
- Spilogale gracilis microrhina
   Western Spotted Skunk
  This uncommon small skunk is found in the Lower and Upper Sonoran life-zones
  usually in dry rocky or brushy hillsides. SDNHM specimens: Jamul, Ramona, San
  Diego area, Santa Ysabel, Witch Creek. Other localities: Julian, Escondido, Cuyamaca Mountains (Hall, 1926: 53); La Puerta, Dulzura (Hall and Kelson, 1952: 355).
- Mephitis mephitis holzneri

   Striped Skunk
  The common skunk of the county is found chiefly in the Upper Sonoran life-zone
  and into the Lower Sonoran. Usually it occurs in brushy woodland and chaparral
  hillsides, but it has become adapted to city living where it acts as a scavenger.
  SDNHM specimens: Lake Hodges, Otay, San Diego area, San Onofre, Santa Ysabel.
  Other reported localities (Grinnell, et. al., 1937: 317): Campo, Cuyamaca Mountain,
  Warner Pass, Witch Creek, Vallecito.

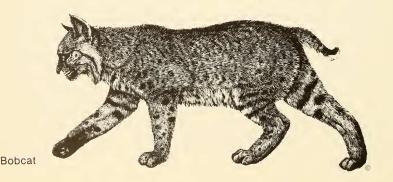

Mountain Lion

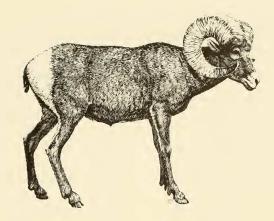

Family Felidae (Cats)

• Felis concolor californicus
• Mountain Lion (Cougar, Puma) Found in the Upper Sonoran and Transition life-zones mainly in forested or chaparral-covered mountains where deer (Odocoileus), its chief food, are present. SDNHM specimens: Buckman Springs, Campo, Mesa Grande, Pine Valley, Smith (= Palomar) Mountain. Other specimens (MVZ): south base Los Pinos Mountain, Laguna Indian Reservation, Wynola. Also reported from the Cuyamaca Mountains (J. Grinnell, 1933: 114). According to Stephens (1921: 49), "Still occasionally found in San Diego County. I have never seen one alive out of a cage." At the present time, the California State Fish and Game Department estimates a county population of approximately 25.

• Lynx rufus

• Bobcat (Wildcat)
The bobcat is found throughout the county from the desert to the coast. L. r. baileyi is found in the Lower Sonoran life-zone east of our mountains in brushy and rocky areas usually near springs. Specimens: Sentenac Canyon (SDNHM), Vallecito (MVZ). Paul Johnson, ranger at Anza Borrego Desert State Park, reported seeing them along the western region of the park. L. r. californicus is found west of the desert region most abundantly in the foothill chaparral. SDNHM specimens: Alpine, Cuyamaca State Park, Del Mar, Flynn Springs, Los Flores Mission, Otay, Paradise Valley, Pine Valley, Ramona, San Diego area, San Marcos, Santa Ysabel, Volcan Mountain, Witch Creek. Other specimens (MVZ): Campo, Foster (near Lakeside), Pine Mountain.

Bighorn

# Order Artiodactyla Family Cervidae (Deer and Allies)

- Cervus elaphus

   Wapiti or American Elk Introduced. Twelve elk of mixed Tule-Rocky Mountain stock were liberated in the Laguna Mountain area in 1919 (Dasmann, 1958: 21). They are no longer found in the county, the last report listed seven adults and one young in 1922 (Reddington, 1922: 191).
- Odocoileus hemionus fuliginata
   Southern Mule Deer Found in the Lower Sonoran to Transition life-zones, in chaparral to open forest areas. SDNHM specimens: Alpine, Descanso, Cuyamaca Mountains, Grapevine Spring, Laguna Mountains, and Smith (= Palomar) Mountain. Other specimens (MVZ): Barona Ranch, De Luz, San Mateo Valley: Colb Valley (Cowan, 1933: 327). According to George McCleary, Camp Pendleton Game Warden, there are approximately 3000 to 4000 mule deer on the base. Also reported at Torrey Pines State Reserve and Miramar NAS (R. Dingman, pers. obs.).

# Family Antilocapridae (Pronghorns)

• Antilocapra americana
• Pronghorn (American Antelope) — EXTINCT This animal, unique to North America, was the first species of mammal to be recorded in California at San Diego Bay (Ferrel, 1879: 304). Stephens considered them practically extinct in 1921, although he saw four at Carrizo Creek "many years ago" (1921: 44). The last report was of a band of five near Campo in 1922 (Nelson, 1925: 27). There are no specimens from the county.

#### Family Bovidae (Cattle, Sheep and Allies)

• Ovis canadensis
• Mountain Sheep (Bighorn) This native sheep, also known as the Desert Bighorn, is found in the Lower and Upper Sonoran life-zones on open, rough, barren slopes of our desert region. According to Paul Johnson, Park Ranger at Anza Borrego Desert State Park, the present population numbers 300-400 and has remained constant for the past few years. SDNHM specimens: Borrego area, Carrizo Gorge, Split Mountain, Vallecito, and southeast county. These animals are probably referable to O. c. cremnobates. Specimens at MVZ from Julian have been referred to as nelsoni, although Cowan (1940: 567) considers them intermediate between the two.
